RADIALIGN

FEATURES & BENEFITS

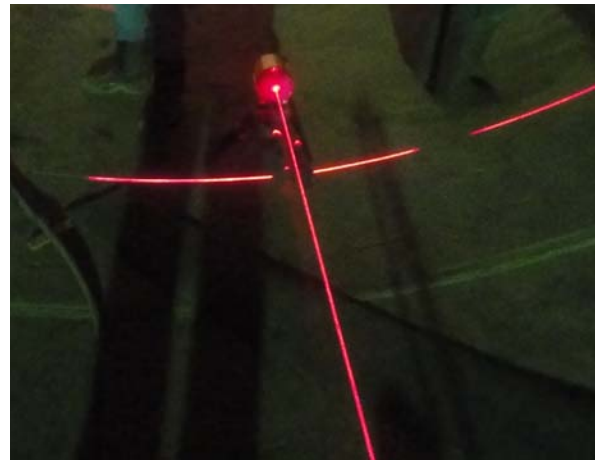

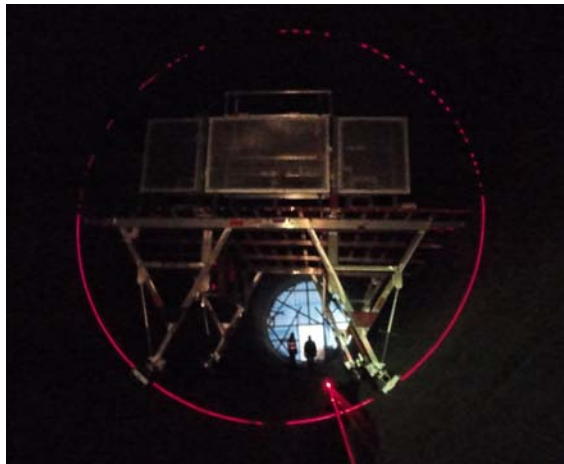

NEW METHOD --- BETTER RESULT

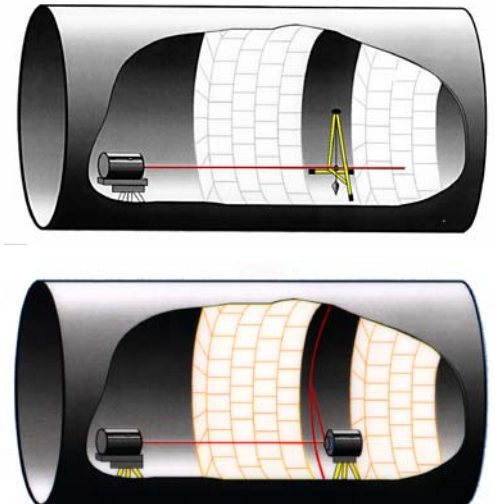

The old method of using the radial welds inside of the kiln has been replaced by the Radialign. Marking the kiln every 10ft (3m) allows the masons to ensure **proper radial alignment**

The Radialign laser ensures the **precise placement** of each row of brick. Radially aligned brick is vital for longer brick life and less downtime. Radialign can be assembled and ready for use in **less than 30 minutes**.

Durable transport box hold brick alignment device. Comes with rechargeable batteries and A/C Adapter.

The Radialign produces a **continuous laser** light parallel to kiln's axis which is intercepted by a rotating pentaprism device. This refracts the laser perpendicular onto the **circumference of the kiln shell**. This line can be marked at points along the kiln, which are then used as an exact reference for installation of the refractory.
